

Two edge classes in the 17-node shipping graph

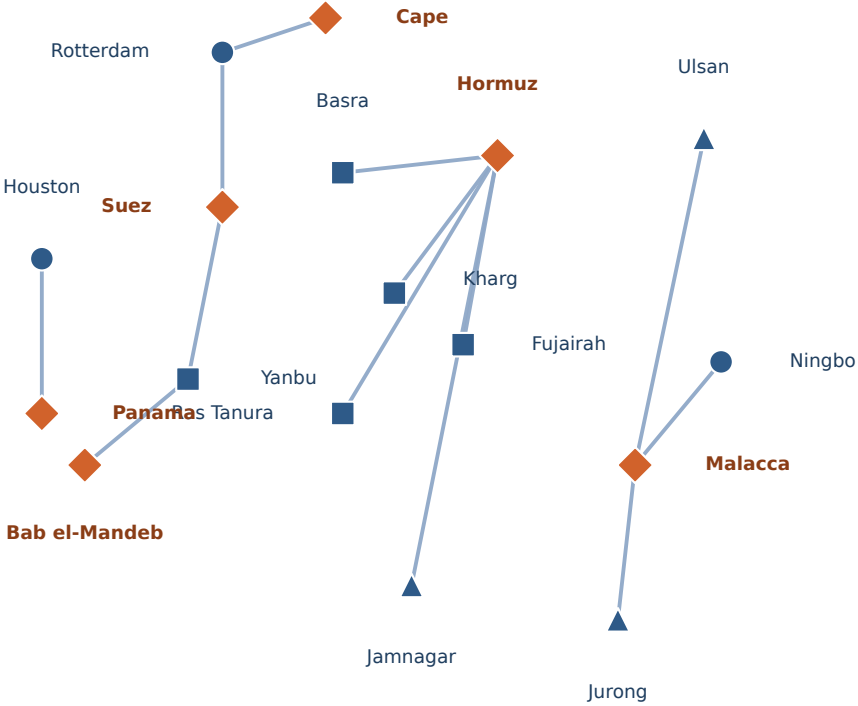

(a) Dynamic voyage edges · AOI → AOI

Directed; week ending Friday 17 March 2023. 42 lanes that week; width $\propto n_{\text{voyages}}$. 24 lanes with ≥ 3 voyages drawn; 18 single- or two-voyage lanes omitted. Changes every week.

(b) Fixed corridor edges · AOI — chokepoint

Undirected; specified ex ante from each site's main oil-trade corridor. 13 links; identical every week. No chokepoint-chokepoint links.

● AOI · port ■ AOI · terminal ▲ AOI · refinery ◆ Chokepoint — Directed voyage edge — Undirected corridor edge

Entering the GAT: the two classes are stacked, then symmetrised and self-looped.

Direction and edge type are not retained. Symmetrised voyage counts enter only as an attention prior (Appendix A.4.3).
